

Cutting Costs & Carbon Emissions With Modular UPS

The Project Partner's Perspective:

“Advances in UPS technology over the last few years, particularly the development of highly-efficient modular solutions, have completely changed the way we view critical power infrastructure.

“Our client’s current and future successes are inextricably linked to having robust and reliable IT capabilities, and with ever-increasing demands on the UK power network likely to result in additional pressures and disruptions in the years to come, it was essential to devise a solution that provides them with all the benefits of greater efficiency without compromising on resilience.

“Upgrading the existing installation to the Riello UPS Multi Power range equips the client with a far more modern, efficient, and resilient power protection system.

“When this additional reassurance was combined with the significant projected financial savings, CO₂ reductions, footprint savings, and increased maintenance opportunities also offered by working in partnership with Riello UPS, it was an easy decision for our client to make.

“And we’ve no doubt it’s a decision that will help them best achieve optimum business performance in the coming years.”
